SafeSend™ adds powerful compliance options to your outgoing email filtering.

Much of the email security industry today focuses on inbound email threat protection, and many companies imprudently downplay the importance of adding protection from email threats and abuse within the organization. SafeSend™ provides this vital layer of protection, allowing you to protect your company's reputation and preventing sensitive information from being leaked via email.

Enforce sending policies
If a bad email is sent, SafeSend stops it and notifies the sender of the violation.

Block sensitive attachment sending
Prevent sensitive information or file leaks from slipping out under the radar.
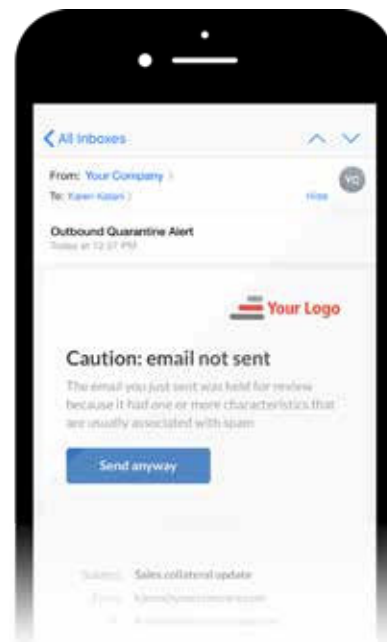

Protects reputation
Prevent embarrassing spam from being sent from within your organization.

Instant blocking notifications

If someone tries to send an email that violates company policy or contains malicious content, SafeSend will block the email and immediately notify them that the message was held. If the administrator permissions allow it, they can **easily release** the email for delivery with a single click.

Policy-based compliance

SafeSend gives administrators the ability to **define which content is not permitted** for email distribution. Utilize pre-defined content lexicons to secure data such as Social Security or credit card numbers, or create custom rules to cover your specific policies or legal compliance needs. SafeSend even lets you benefit from the flexibility of regular expressions to create custom content rules that help you stay compliant.

FEATURES

- Enforce TLS for high security
- Custom outbound rules
- Stop banned attachments
- Prevent information leaks

- Sent spam quarantine
- Message logs
- Stats and reporting
- Reputation protection

- Realtime sending notifications
